Discovery Case Study

GETRONICS ESPAÑA SOLUTIONS
AUDITS ITS TOTAL IT INFRASTRUCTURE
WITH CENTENNIAL DISCOVERY®

Overview

Given the great importance currently placed on gathering the most precise information possible on company computer resources and the subsequent management of the data collected, Getronics España Solutions decided to invest in a software solution to perform these functions.

The need to keep an updated inventory of IT resources for monitoring and maintenance purposes led Getronics España Solutions to opt for Centennial Discovery inventory software, distributed by Micromouse, to automatically conduct a network audit of its 10,000 PCs that are distributed throughout Spain.

Using Centennial Discovery, Getronics España Solutions can now get automatic updates on:

- the availability of its IT resources
- the physical location of all PCs to be inventoried using Centennial's LanProbe
- technology, which identifies all the network connections of each device
- the hardware and software configurations of audited machines

- all changes made to PCs at both hardware and software levels, alerting the relevant department when necessary
- the hardware and software needs of the company's PCs

The ability to export this data to an SQL Repository facilitates data processing for use in the future, for use in other applications and producing statistics. Getronics S.A. affirms that Centennial Discovery functions seamlessly, and the company hopes to rapidly recoup its investment as a result of the software's benefits. These include simple, fast and flexible installation, minimal impact on network performance, and the ability to program inventory and report management through the product's query engine.
